

Keep Your Birds Cooler.

With our Super Cool Insulated Pipe

Cooler, cleaner and fresher water provided by this new patent pending innovative system allows the bird to be cooled inside and relieves stress during hot periods of time. You will gain 4 to 5 points in feed conversion during hot temperatures and improve average bird mortality ratios by 1 to 5 percent. Mortality during extremely hot days in which growers have experienced huge bird losses can virtually be eliminated. Less mortality, better feed conversion, dryer litter, better medication transmission and less wasted water, transmit into large savings. This new patent pending system costs only slightly more than our standard floor system.

System Advantages:

- Cooler water to birds.
- No light penetration into line which minimizes algae in lines.
- Quicker transmission of medication.
- Less obstruction in pipe from saddle or nipple which allows complete line flushing.
- Eliminates condensation on nipple lines, maintaining drier litter.
- Very rigid pipe helps eliminate air lock.
- Less water needed to flush lines.

Insulated Pipe Adapter

The insulated pipe adapter creates a sealed insulating air chamber throughout the length of the pipe.

The adapter seals off the insulating air chamber, keeping the heat out and the cold in.

Water Chiller

Normal high pressure well systems which provide cool water do not need this cooling unit. Cooling unit should only be used when incoming water temp. is approx. 70°F or above. Water chiller has an adjustable program which only runs when you, the grower, think the incoming water is too hot. Incoming water temp. will be cooled between 20°F & 30°F.
