

GUNSLINGER™

a d v a n c e d r o d e n t c o n t r o l t e c h n o l o g y

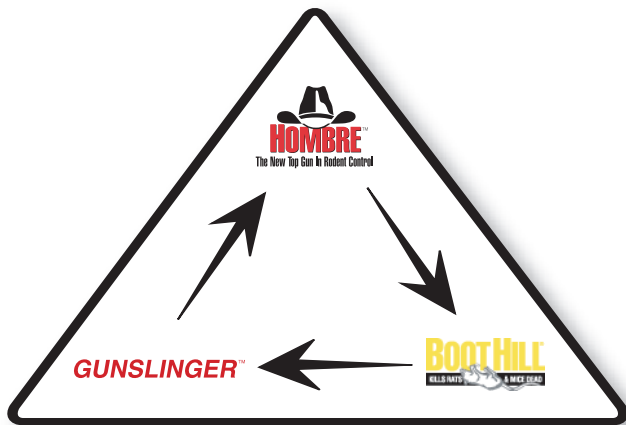

- Different mode of action – fits a rotational program.
- Fast knockdown of rodent populations.
- An acute rodenticide with stop-feed action.

Gunslinger™, the key to resistance management!

The active ingredient, bromethalin, is an acute rodenticide, not an anticoagulant. Gunslinger breaks the anticoagulant baiting cycle. Rodenticide rotation starts with Hombre™ and ends with Gunslinger, another rotation partner: Hombre™ – BootHill® – Gunslinger™.

- Stop-feed action kills more rodents with less bait – reduces cost.
- The newest bromethalin brand.
- No known resistance.
- Fast results – rodent death in 1 to 2 days.
- Stops resistance by breaking the anticoagulant baiting cycle.
- Convenient, easy-to-use baiting options: mini-blocks or pellet place packs.
- Cost-effective rodent control.

Liphatech Rotation Partners

Gunslinger mini-blocks, with stop-feed action, offer a flexible placement option as part of your rotation program.

Gunslinger place packs can be secured to rods in a BaitSafe II station for maximum freshness and palatability.
